Notes and Definitions

Analytes in **bold** are values above the reporting limit.

Sample results are reported on an "as received" basis.

BD - Analyte result is below the method reporting limit.

Matrix matched quality control check samples for cannabis are available for microbiological analysis only. Matrix matched quality control samples for the other analytes do not exist for cannabis at this time. Due to this unavailability, even ISO/IEC validated methods cannot be fully verified for the efficiency and accuracy of the extraction and analysis in any current Maine or New Hampshire laboratory setting.

The sample date, if not listed on the submission form, will be recorded as the date the samples were received.

Heat activation of cannabis products converts THCA to THC and CBDA to CBD in a time and temperature dependent manner. This conversion is known as decarboxylation and results from the loss of CO₂ during heating. Max THC and Max CBD results are calculated to account for the loss of CO₂ that occurs during this process.
